

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at <http://books.google.com/>

THE MELLIN'S FOOD METHOD OF PERCENTAGE FEEDING

The Mellin's Food Method provides the physician with a means of using Mellin's Food in percentage feeding without the necessity of making calculations. By the use of the tables and formulas here presented, any desired composition in a feeding mixture may be obtained. The formulas show not only how great is the range of variations, but also that Mellin's Food, when used with milk, as it usually should be, has great adaptability and will meet any condition of infant feeding.

The use of these tables does not require any calculations, but is as nearly automatic as a work of this kind can be.

The milk tables alone will be found of great value to the physician; they show two different methods for obtaining Creams, Top Milks, and Bottom Milks. These tables we believe to be reliable, as they are the result of a great many tests in our laboratory.

Mellin's Food is a true modifier of milk, for not only may any desired proportions of constituents be obtained, but also the physical condition of the casein of the milk is so changed by the Mellin's Food, that it does not form tough, indigestible curds in the stomach, so trying to the infant digestion.

THE MELLIN'S FOOD METHOD

OF

PERCENTAGE FEEDING

HOW TO USE THE MELLIN'S FOOD METHOD OF PERCENTAGE FEEDING

LET us assume that we wish to make a mixture having Proteids 2%, Fat 3%, and Carbohydrates 7%. On turning to the Percentage Table Index we find on page 12, Proteids 2%, Fat 3%, Carbohydrates 7%. Against these percentages, we find Formula No. 331, page 116. Turning to page 116 we find Formula No. 331, which calls for

MELLIN'S FOOD

519 grains, or 4 level tablespoonfuls and
3 level teaspoonfuls

Proteids 2.00

Fat 3.00

FRESH MILK

2½ fluidounces

Carb. 7.00

TOP MILK (10% Fat)

4½ fluidounces

WATER

9¾ fluidounces

This formula calls for Top Milk with 10% Fat. In the Top Milk Tables we find how to make Top Milk 10% Fat from different milks. We will suppose that

the milk obtainable has $3\frac{1}{2}\%$ Fat; on page 161 is the table for preparing 10% Top Milk from milk containing 3.4% to 3.6% Fat.

HOW TO CHANGE PERCENTAGE OF CONSTITUENTS WHEN COMPOSITION IS KNOWN

Let us assume that we have a case of infant feeding which is not getting along satisfactorily. We will say that the baby is being fed with a mixture which, perhaps, contains too much Proteid, indicated by the undigested curds found in the stools; that the Fat and Carbohydrates seem about right and that we wish to reduce the Proteids about $\frac{1}{2}$ of 1%. We turn to the Percentage Table Index, find the percentage formula which shows Proteids $\frac{1}{2}$ of 1% less than the one now being used, but in which the other constituents are the same. We note the page and formula number against this Index Formula. The formula number on the page indicated will show the formula which will produce the exact proportions required.

Example: We will assume that a mixture is being used, the constituents of which are Proteids 2%, Fat 2%, and Carbohydrates 4%, and that a formula is desired which will give the following proportions of constituents: Proteids 1.5%, Fat 2%, Carbohydrates 4%.

We turn to the Percentage Table Index and find the desired percentage (page 8). This refers to page 74, Formula 213, where we find the formula which gives a mixture containing 1.5% Proteids, 2% Fat, and 4% Carbohydrates.

HOW TO CHANGE PERCENTAGE OF CONSTITUENTS WHEN COMPOSITION IS UNKNOWN

Let us assume that a child is taking a mixture, the percentage composition of which is not known. We find in the Formula Index (page 19) the group which contains the *same* ingredients as those in the mixture being used; then, turning to the pages indicated, find the formula giving similar quantities of Mellin's Food and of the other ingredients; the analysis of this formula shows very closely the composition of the mixture being used. If, for instance, it is desired to change the proportion of Fat, we look in the Percentage Table Index for the percentage having the desired variation. The corresponding formula will give definite directions which will produce the desired change. We will suppose that the following mixture is being given :

MELLIN'S FOOD	3 tablespoonfuls
MILK	6 fluidounces
TOP MILK	4 fluidounces
WATER	6 fluidounces

The nearest formula to this is (page 89) No. 395 :

MELLIN'S FOOD	3 tablespoonfuls
MILK	5½ fluidounces
TOP MILK	4 fluidounces
WATER	6½ fluidounces

which has the following composition :

Proteids	2.49
Fat	3.02
Carbohydrates	6.01

or in round numbers, Proteids 2.5 %, Fat 3 %, Carbohydrates 6 %.

If we wish to reduce the Fat $\frac{1}{2}$ of 1 %, we find in the Percentage Table Index the proportions, Proteids 2.5 %, Fat 2.5 %, and Carbohydrates 6 % (page 15). This refers us to page 89, Formula 389, which gives the desired percentage of constituents.

From the foregoing, the physician will at once see that the Mellin's Food Method is a simple, practical, and accurate system for making any possible combination of Proteids, Fat, and Carbohydrates in a mixture for infant feeding. The Mellin's Food Method is a time-saver and a short cut which will save many hours of tedious computation and will furnish correct formulas which may be relied upon implicitly, the variation, excepting in one or two formulas, not being more than $\frac{5}{100}$ of 1 % from the formula required.

The table of formulas is large and contains practically every probable formula desired; also many which never will be used, as they are not properly balanced rations, their proportions departing so far from those in human milk and also from those in mixtures recommended by leading pediatricists as to be abnormal, but they are included in the tables in order to complete all the variations from the lowest to the highest.

The Proteids range from .3 of 1% to 3.5%

The Fats range from 0 to 4 %

The Carbohydrates from 2% to 7 %

The Proteids, with a few exceptions, rise from the lower to the next higher by a uniform difference of .25 of 1%. The Fats and Carbohydrates, except in a few cases, rise from the lower to the next higher by a uniform difference of .5 of 1%. These differences are believed to be sufficiently small to meet all the requirements of infant feeding, and the range of analyses embraces all the combinations of Proteids, Fats, and Carbohydrates advised by specialists in this line of work to meet the varying requirements of infant feeding.

For temporary feeding, there will be found many formulas in which the nutritive value is low, but which will be found invaluable in starting very delicate cases and cases requiring radical changes from normal feeding.

The formulas of Mellin's Food with Water and Mellin's Food with Whey are formulas which have been found exceedingly useful in many cases where the stomach does not tolerate milk in any quantity ; beginning with such formulas as these, milk should be gradually added until the child is able to take and retain a full and properly balanced ration.

There have been several attempts to make practical tables of formulas for percentage feeding, but the Mellin's Food Method is the first, we believe, to furnish a simple, automatic, practical table, which calls for absolutely no mathematical work on the part of the physician, and which gives at once a formula for a given proportion of Proteids, Fat, and Carbohydrates.

These tables are accurate and the result is less than $\frac{1}{100}$ of 1% above or below the percentage desired. These small differences are well within the errors or differences in practical measurement of materials and the variability in the composition of milk, cream, etc. This extreme accuracy in some cases makes necessary the use of apparently small quantities of some of the ingredients, but with ordinary care any formula in this book may be prepared.

The Mellin's Food Method enables the physician readily and surely to give definite directions for such changes and modifications as may seem best.

The modifications are retained under the supervision of the physician, who can, if necessary, change the proportions of a feeding mixture at any time and know what is being given without a long, tedious task of calculation and with a certainty of knowing that the combination ordered will produce the desired percentage. Having decided on the percentage to be used the proper combination may be found immediately.

The physician will at once comprehend the advantages of the Mellin's Food Method of Percentage Feeding; its simplicity, its accuracy, and its adaptability. The Mellin's Food Method of Percentage Feeding is designed as an aid to the physician in modifying milk, that by its use he may obtain accurate results and know just what proportions of constituents are being given to the infant.

CALORIE — FUEL VALUE

The value of food as fuel, or heat-giving property, is expressed in terms of potential energy. The unit commonly used is the Calorie, which is the amount of heat which will raise the temperature of a kilogram of water 1 degree C.

The Caloric value of Protein, Fats, and Carbohydrates generally adopted is as follows (Rubner) :

1	gramme of Protein	4.1	Calories
1	" " Fat	9.3	"
1	" " Carbohydrates	4.1	"

The quantity of food required by artificially fed infants varies according to the conditions of the infant. The daily number of Calories required varies from 70 to 100 Calories per kilogram of weight of the child.

This would apply as follows: Take, for example, an infant 3 months old whose weight is 13 lbs. There being, approximately, 2.2 lbs. in a kilogram, the weight expressed in kilograms would be 5.9 kilos. Multiplying the number of kilos by 70 gives 413 Calories, the number of Calories per day needed by an infant of 3 months and 13 lbs. weight.

The following formula for an infant of 3 months, page 23, Formula 311, gives 13.5 Calories per fluidounce.

Proteids	2.01	
Fat	1.83	
Carbohydrates	4.51	
Calorie value		13.5

Thirty (30) fluidounces in 24 hours at 13.5 Calories per fluidounce equals 405 Calories in 24 hours, which should be sufficient. As the Protein, Fats, and Carbohydrates are interchangeable, so far as the Caloric value is concerned, the Fats may be reduced or the Carbohydrates increased or all the constituents varied to meet the digestive ability and condition of the

infant so long as the total Caloric value is maintained. For instance, in the foregoing formula, if the Fat be found excessive for a given infant, then the Fat can be reduced and the Carbohydrates increased to maintain the total Caloric value, as follows, page 29, Formula 306 :

Proteids	1.99	
Fat	1.51	
Carbohydrates	5.03	
Calorie value		13.3

Thirty (30) fluidounces in 24 hours at 13.3 Calories per fluidounce equals 399 Calories in 24 hours.

In case any physician meets with any difficulty in using these formulas or tables, or by any chance wishes for a formula not included in these tables, we shall be pleased to answer inquiries and will furnish any formulas desired on request.

We will appreciate any correspondence from physicians on The Mellin's Food Method of Percentage Feeding, and on the subject of Infant Feeding with Mellin's Food.

MELLIN'S FOOD COMPANY
BOSTON, MASS.

Percentage Table Index

Giving Formulas

from

Proteids .30% Fat .00% Carbohydrates 2.25%

to

Proteids 3.50% Fat 4.00% Carbohydrates 7.00%

In these formulas there are both animal and vegetable proteids; the former of the milk, the latter of Mellin's Food.

The fat is milk fat; Mellin's Food containing but a trace of fat.

The carbohydrates are lactose of the milk and maltose and dextrin of Mellin's Food. Mellin's Food is starch free.

Milk Tables

**For Making Cream, Top Milk, and Bottom
Milk Having a Definite Percentage of Fat**

PREPARATION OF CREAMS, TOP MILKS AND BOTTOM MILKS FROM BOTTLED MILK

We give here tables for preparing creams, top milks, and bottom milks directly from bottled milk as it is delivered to the consumer. Where milk is delivered in quart bottles the following tables will probably be found the more practicable.

We wish to call attention to the fact, lest it be overlooked, that these milk tables, besides containing information for preparing creams, top milks, and bottom milks, also give data for preparing a milk of fair or average quality (one containing from 3.70% to 4% of fat) from milks containing either a lower or higher percentage of fat. For instance: In preparing *top* milks from bottled "Market" Milk the top 24 fluidounces of a bottle of milk will contain 3.80% fat when the original milk contains 3% to 3.20% fat. On the other hand, in preparing *bottom* milks from bottled "Market" Milk, the bottom 31 fluidounces of a bottle of milk will contain 3.80% fat when the original milk contains from 4.40% to 4.50% fat. In other words, the tables show how a physician may make a milk of average quality (3.70% to 4% fat) from a milk either poorer or richer in fat by taking off the proper quantity of top or bottom milk. As the analyses in "The Mellin's Food Method of Percentage Feeding"

are based on the use of milk of average quality, the data referred to in the tables enable the physician to use the Method when the milk available is known to be above or below average quality.

As in the other tables given, the figures in the following tables are derived from the results obtained in a very large number of experiments on bottled milk made in the laboratory of this Company. It may be of interest to state here that in this series of experiments over 1700 quart bottles of milk were used and over 3400 fat determinations made.

Cream dippers, like or similar to those here represented, are extremely useful for separating bottled milk into creams, top milks and bottom milks; by their means it is possible to remove the upper strata from the lower ones with greater nicety than can be done by simply pouring off or decanting the upper portions. Such dippers, we believe, are now very generally obtainable from dealers in kitchen furnish-

Cylindrical
Cream
Dipper

Capacity
1 fluid-
ounce

Conical
Cream
Dipper

Capacity
 $\frac{1}{2}$ fluid-
ounce

ings. The small conical dipper, while not absolutely necessary, is very convenient for removing the first ounce of cream, as it can usually be introduced into the almost full milk bottle without overflowing the cream; otherwise a spoon must be used for removing the first portion of cream. If the dipper or spoon is first wet with cold water, the cream will not stick to it. The Milk Tables contain data for making as rich creams as can be obtained, practically, by the gravity process. In the comparatively small number of formulas requiring creams of higher fat percentages than the Milk Tables give information for preparing, centrifugal creams must be used. The skimmed (separated) milk called for in a few formulas must also be obtained by the centrifugal process.

Table

For Preparing Creams and Top Milks from "Market" Milk as
Delivered to Consumer in Quart Bottles

By "Market" Milk is meant milk that, after being drawn, is kept at a low temperature from 12 to 24 hours before being bottled, and that has stood in the bottles from 12 to 16 hours, — or until the cream line has become well defined.

CREAM, TOP MILK AND BOTTOM MILK TABLES

The percentage of fat in top milk and cream made by gravity method is affected greatly by different conditions:

1. The quality of the milk.
2. The age of the milk.
3. Size and shape of the container.
4. Temperature while cream is rising.
5. Length of time set.

The fat rises more rapidly and completely in milk when it is cooled and set immediately after being drawn than it does in milk that has been kept cold for twenty-four hours and is then mixed and set. We have found that a practical method for obtaining a top milk or cream is to use an ordinary, straight-sided, quart measure as a container, for setting the milk, and to use a spoon, with the bowl bent at right angles to the handle, for the skimmer. With a bent spoon any quantity of milk or cream may be easily removed without disturbing the layer of cream. A shallow dish may be used for setting the milk if preferred.

In order to meet the different conditions which may arise we give the following tables, which give the

Bent Tablespoon for Skimming

CONTAINERS TO BE USED FOR
SETTING MILK

Tin Quart Milk Measure

Shallow, Tin, Milk or Pudding Pan
Capacity, 30 Fluidounces

temperature and the number of hours which a given quantity of milk should be set to give results desired. The temperature given is easily obtained in an ordinary refrigerator. If the refrigerator be too cold or below 55° F. the temperature may be adjusted by leaving its door open a little.

It is *important* that the temperature of the original milk should be brought to 55° or 60° F. before setting. The milk to be used may be placed in a larger vessel containing water of 60° F. and slowly stirred a few minutes until the temperature is raised or lowered as desired, then set according to the directions. If the directions are followed as given in the table, practically accurate and uniform results will be obtained.

In our laboratory we have devoted a great deal of time to an investigation of this subject, and in the tables we give the figures deduced from experimental work involving the use of over 1450 quarts of milk, and the making of nearly 1800 fat determinations.

HOW TO USE THE TABLE FOR TOP MILK OR CREAM

Let us assume that 2 oz. of a top milk containing 7% fat is wanted, and that the milk contains between 3.70% and 4% fat; turning to the table you find that the top 10½ oz. of milk after setting five hours gives top milk containing 7% fat.

Table

**For Obtaining Top Milks Containing from 3.7% to 13% Fat from
"Market" Milk**

% Fat in Original Milk	Temp. of Original Milk	Quantity to be Used	Container to be Used	Temp. of Refrigerator or Room	Number of Hours to be Set	Quantity to be Taken Off	% of Fat obtained in Top Milk
3%	55° F to 60° F	32 f. oz.	Quart Milk Measure	55° F to 60° F	5	20 f. oz.	3.7%
"	"	"	"	"	5	7 f. oz.	7%

"	"	"	"	"	5	2½ f. oz.	27½ f. oz.	2.50%
"	"	"	"	"	5	1 f. oz.	29 f. oz.	3.00%

* It is perhaps unnecessary for us to say that, as a matter of economy, the top milks and creams obtained in the preparation of bottom milks need not necessarily be thrown away and wasted, but may be utilized in the household; the same holds true with reference to bottom milks obtained in the preparation of top milks and creams.

Analyses

Analyses

THE following analyses of Mellin's Food, Cow's Milk, Skimmed Milk, Bottom Milks, Top Milks, and Creams, and Whey, are those on which the computation of the formulas in "The Mellin's Food Method of Percentage Feeding" were based. These analyses were made by Mellin's Food Company's Chemist, Edward E. Babb, Ph. G.

Analysis of Mellin's Food

Fat	.	.	.	.	.	.	.	.	0.16
Proteids	.	.	.	.	.	.	.	.	10.35
Soluble Carbohydrates (no starch)	.	.							79.57

Water	.	.	.	.	.	.	.	.	5.62
									<u>100.00</u>

Mellin's Food is starch free.

The Carbohydrates are Maltose and Dextrin.

The weight of a level tablespoonful of Mellin's Food is 105 grains.

The weight of a level teaspoonful of Mellin's Food is 33 grains.

One level tablespoonful of Mellin's Food added to a 16-ounce mixture increases the percentage of

Proteids 0.14%
Carbohydrates 1.10%

PREPARATION OF WHEY

A given quantity of milk will yield about three-fourths of its volume of whey.

Put a quantity of cold milk, depending upon the amount of whey required, into a suitable vessel—a saucepan or other small pan answers the purpose well—and add to it liquid rennet or essence of pepsin in the proportion of two teaspoonfuls of liquid rennet or essence of pepsin to one pint of milk. Mix by stirring gently with a spoon and then warm to about 100° F., not over 104° F., and keep at this temperature until coagulation occurs. This is easily done by setting milk in a pan or vessel of water, keeping the water at a temperature of about 105° F. After coagulation has taken place, break the curd up into small pieces with a fork, and keep the mixture warm for a little while longer until the curds have shrunk somewhat, as the yield of whey is thereby increased appreciably and the straining facilitated. Prepare a strainer by laying one or two thicknesses of muslin or cheese-cloth, which has previously been washed in boiling water and dried, across a funnel or colander; transfer the curd and whey mixture to the strainer and collect the filtered liquid or whey. It is best not to use any pressure or squeezing in straining; the passage of the whey through the strainer is aided con-

siderably by raising first one side and then another of the strainer cloth from its support occasionally.

The whey thus prepared is ready for use if milk is not to be added. If milk or cream is to be added to the whey, the whey must first be heated to a temperature of 65° C. or 149° F. for a few minutes, at which temperature the milk curdling ferment in the rennet extract or essence of pepsin is "killed" or rendered inactive; otherwise the whey would coagulate the casein of the milk or cream. It is very important, however, that this temperature be not exceeded very much, as incipient coagulation of lactalbumin begins at about 70° C. or 158° F.

It may be added that skimmed milk, if fresh, or milk from which top milk has been prepared, answers just as well for making whey as whole milk and, for economical reasons, is to be preferred.

GENERAL REMARKS ON THE USE OF MELLIN'S FOOD

Mellin's Food is a dry, soluble extract made from wheat and barley malt, and consists of maltose, dextrin, proteids, and salts. Mellin's Food is entirely free from unconverted starch and cane sugar.

Mellin's Food is a preparation for the modification of fresh cow's milk.

The potassium salts of Mellin's Food furnish alkaline constituents similar to those found in human milk, and physiologically suited for infantile digestion.

There are many reasons to sustain our belief that the carbohydrates, maltose and dextrin, of Mellin's Food are preferable to other carbohydrates for use in modifying cow's milk.

We advise that all the mixtures of Mellin's Food and milk should stand at least two hours before using. The reason for this is, that the Mellin's Food acts on the milk and softens the casein, so that when it is coagulated in the stomach, the curds are light and flocculent and easily digestible. The physician will obtain excellent results if this rule is observed.

MELLIN'S FOOD COMPANY

BOSTON, MASS.

The following publications are issued by the Mellin's Food Company of North America. Copies will be sent to any physician free, on request:

The Mellin's Food Method of Percentage Feeding
The Home Modification of Cow's Milk
Formula Booklet
The Care and Feeding of Infants
Diet after Weaning
Weight Chart
